

## Silent installation instructions

First generate a configuration file. You can do that by making a test installation and configure the Host according to your needs with the Host Manager (See Host configuration guide: [https://download.wisemo.com/download/Windows\\_Host\\_Guide\\_EN.pdf](https://download.wisemo.com/download/Windows_Host_Guide_EN.pdf)). Save the configuration (Home ribbon | Save As) to some repository you want to install from (the file must be called host.xml), e.g. \\Server\SilentInstallationRepository\host.xml

For the actual installation you need to copy the configuration file (host.xml) to the appropriate folder on the target computer first:

```
XCOPY "\\Server\SilentInstallationRepository\host.xml" "%ProgramData%\WiseMo\WiseMo RSM\Remote Desktop Host\" /V /Y
```

To install, you will need the license key you got when you purchased the Host or that you got in the trial mail. If you are installing a Host to be used with myCloud you can use this license key: WHW0160-27FZ-ZZB87N-NZ6A-000012

Then run the silent installation like this:

```
MSIEXEC.EXE /quiet /i "\\Server\SilentInstallationRepository\WsmHost.msi"  
WSM_BUILTIN_LICENSE_KEY=WHW0160-27FZ-ZZB87N-NZ6A-000012 /I  
"\\Server\SilentInstallationRepository\%computername%.log"
```

A log file will be saved.
